

Publishing and Sharing in Tableau

Name: Ankit Verma

Email: vankit54@gmail.com

1. What is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/ Cloud in terms of accessibility and data security?

Ans. The key difference between publishing a dashboard on **Tableau Public** and **Tableau Server/Cloud** is:

- **Tableau Public:**
 - Dashboards are **publicly accessible to everyone on the internet** ◦ **No data security** — anyone can view and download the data
- **Tableau Server/Cloud:**
 - Dashboards are **restricted to authorized users only** ◦ Provides **strong data security, permissions, and access control**

2. When publishing a Tableau dashboard, what happens to a live connection compared to an extract? How does this affect data refresh and performance?

Ans. When publishing a Tableau dashboard:

- **Live Connection:**
 - The dashboard stays connected to the **original data source** ◦ Data is **always up-to-date (real-time)** ◦ Performance can be **slower** if the data source is large or network is slow ◦ No need for scheduled refresh (it updates automatically)
- **Extract (Hyper file):**
 - A **snapshot of data** is saved with the dashboard ◦ Data is **not real-time** — requires **scheduled refresh** ◦ Performance is **faster** because data is stored locally in optimized format

3. In Tableau Server or Cloud (conceptually), which feature allows administrators to control which users can view, interact with, or edit a published dashboard?

Ans. In Tableau Server or Tableau Cloud, the feature used to control who can view, interact with, or edit a published dashboard is called **Permissions**.

- **Permissions** allow administrators to:
 - Control **who can view** the dashboard
 - Decide **who can interact** (filter, explore, etc.)
 - Restrict or allow **editing and downloading**

4. If you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?

Ans. To allow users to **view a dashboard but not download the underlying data** in Tableau Server/Cloud, you should adjust the **“Download Data” permission**.

- Set **Download Data = Deny**
- Keep **View = Allow** This ensures:
 - Users can **see and interact** with the dashboard
 - Users **cannot download or access the raw data**

5. Name two methods by which a Tableau dashboard can be embedded into a web page or website.

Ans. Two methods to embed a Tableau dashboard into a web page or website are:

- **Using Embed Code (iFrame)** ◦ Copy the **embed code** from Tableau Server/Public ◦ Paste it into the HTML of your website using an **<iframe>**
- **Using Tableau JavaScript API** ◦ Integrate the dashboard using **Tableau’s JavaScript API**
 - Allows more **interactivity and customization** (filters, events, etc.)

6. List two best practices you should follow when preparing a dashboard for public sharing to ensure data security and privacy.

Ans. Two best practices to ensure **data security and privacy** before sharing a dashboard publicly are:

- **Remove or anonymize sensitive data**
 - Do not include personal, confidential, or business-critical information
 - Replace real values with **dummy or aggregated data** if needed
- **Check data source and permissions carefully**
 - Ensure no hidden sheets or data sources expose sensitive information
 - Verify that only intended data is visible before publishing

7. After publishing a dashboard, users report a “Data not found” error. What is the most common cause related to data source setting.

Ans. The most common cause of a “Data not found” error after publishing a dashboard is:

Incorrect or missing data source path/connection

- The original data source (like Excel file, database, or server) is **not accessible** from Tableau Server/Cloud
- File paths may still point to a **local system (your computer)** instead of the server
- Credentials or connection settings may be **missing or not embedded**

8. When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented to ensure only authorized users can access the embedded content?

Ans. When embedding a Tableau dashboard into a secure internal portal, two important security measures are:

- **User Authentication (Login system)**
 - Ensure users must **log in** (via Tableau Server/Cloud authentication, SSO, etc.)
 - Only authorized users can access the dashboard
- **Row-Level Security (RLS)**
 - Restrict data so users can **only see data relevant to them**
 - Prevents exposure of sensitive data across different users
